Art Unit: 2671

**EXAMINER'S AMENDMENT:** 

In claim 29, line 1, replace "29" by -28--.

NOTICE OF ALLOWANCE:

The following is an examiner's statement of reasons for allowance:

A method for conservative stencil culling in a graphics pipeline.

comprising: maintaining stencil values for regions at a plurality of levels of an image pyramid; determining whether the stencil value for a region at one or more coarser levels is valid; and performing conservative stencil culling on the region utilizing the stencil value at the coarser level if the stencil value at the coarser level is valid.

A data structure comprising: <u>a valid indicator object indicating whether all</u>

<u>stencil values of a region are equal to each other</u>; and a stencil value object

including <u>a stencil value equal to the stencil values of the region</u> if all of the

stencil values of the region are equal to each other.

A method for multiple-pass rendering in a plurality of pipelines using conservative occlusion culling, comprising: during a first pass in a first pipeline, passing objects from an input stream to a culling stage of the first pipeline for creating an occlusion image in a first depth buffer requiring a first amount of storage; and during a second pass in a second pipeline, sending the objects to a culling stage of the second pipeline for conservatively culling occluded objects utilizing the occlusion image, and passing to a renderer remaining objects, wherein the renderer requires a second depth buffer with a second amount of storage greater than the first amount of storage.

Application/Control Number: 10/658,171 Page 3

Art Unit: 2671

A system for avoiding processing in a multi-pass rendering algorithm in a graphics pipeline, comprising: means for a first pass including logic for determining whether at least a portion of the object has been culled, and logic for storing visibility information indicating whether the at least portion of the object has been culled, and means for a second pass including: logic for conditionally skipping processing in at least a portion of the graphics pipeline based on the visibility information.

A system for avoiding processing in a multi-pass rendering algorithm in a graphics pipeline, comprising: means for a first pass including logic for determining whether a last object processed within an entity of a screen is entirely visible, and logic for storing status information indicating whether the last object processed within the entity of the screen is entirely visible; and means for a second pass including logic for, when rendering each object within the entity of the screen, avoiding writing and reading z-values to and from a z-buffer if the status information indicates that the last object processed within the entity of the screen was entirely visible.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
